IB Robustness: Investment

Table IB.1: Across-firms reallocation: Intensive and Extensive margin

The table presents the reduced-form estimates based on Equation Equation 1 where the dependent variable is capital expenditures normalised by lagged total assets based on the yearly panel of Compustat firms for 1965-2007. The investment duration measure is respectively firm-level average asset maturity, firm-level average fixed asset maturity, firm-level average fixed asset share, and the orthogonal components of the latter two. Government long-term bond supply is measured with the weighted-average maturity of Treasury debt. Details for variable definition in Appendix A. Lower-level interactions are not reported for ease of presentation. Standard errors reported in parentheses are double clustered by time (fiscal year-end) and firms.

	Capital Expenditures

Table IB.2: Across-firms reallocation: Alternative *Asset Maturity* definitions

The table presents the reduced-form estimates based on Equation Equation 1 where the dependent variable is capital expenditures normalised by lagged total assets based on the yearly panel of Compustat firms for 1965-2007. The investment duration measure is the firm-level average asset maturity in column (1), the measure constructed from observations of firms reporting straight-line depreciation in column (2), and the measure constructed without subtracting amortisation from depreciation in column (3). Government long-term bond supply is measured with the weighted-average maturity of Treasury debt. Details for variable definition in Appendix A. Lower-level interactions are not reported for ease of presentation. Standard errors reported in parentheses are double clustered by time (fiscal year-end) and firms.

Table IB.3: Across-firms reallocation: Robustness to collateral channel

The table presents the reduced-form estimates based on Equation Equation 1 where the dependent variable is capital expenditures normalised by lagged total assets based on the yearly panel of Compustat firms for 1975-2007, where MSA-level real estate prices are available. The investment duration measure is the firm-level average asset maturity. Government long-term bond supply is measured with the weighted-average maturity of Treasury debt. Details for variable definition in Appendix A. Lower-level interactions are not reported for ease of presentation. Standard errors reported in parentheses are double clustered by time (fiscal year-end) and firms.

Table IB.4: Across-firms reallocation: Robustness to different time periods

The table presents the reduced-form estimates based on Equation Equation 1 where the dependent variable is capital expenditures normalised by lagged total assets based on the yearly panel of Compustat firms for 1965-2007 and other sample cuts indicated in column heads. The investment duration measure is the firm-level average asset maturity. Government long-term bond supply is measured with the weighted-average maturity of Treasury debt. Details for variable definition in Appendix A. Lower-level interactions are not reported for ease of presentation. Standard errors reported in parentheses are double clustered by time (fiscal year-end) and firms.

Table IB.5: Across-firms reallocation: Alternative measures of long-term bond supply

The table presents the reduced-form estimates based on Equation Equation 1 where the dependent variable is capital expenditures normalised by lagged total assets based on the yearly panel of Compustat firms for 1965-2007. The investment duration measure is the firm-level average asset maturity. Government long-term bond supply is measured with respectively the weighted-average maturity of Treasury debt, the weighted average duration of Treasury debt, maturity-weighted Treadury debt-to-GDP, and Treasury debt supply in ten-year duration equivalents. Details for variable definition in Appendix A. Lower-level interactions are not reported for ease of presentation. Standard errors reported in parentheses are double clustered by time (fiscal year-end) and firms.

Table IB.6: Across-firms reallocation: duration versus irreversibility

The table presents the reduced-form estimates based on Equation Equation 1 where the dependent variable is capital expenditures normalised by lagged total assets based on the yearly panel of Compustat firms for 1965-2007. The investment duration measure is the firm-level average asset maturity. Government long-term bond supply is measured with the weighted-average maturity of Treasury debt. I control for firm and industry-level measures of irreversibility of investment from Kim and Kung (2017) and Kermani and Ma (2022). Details for variable definition in Appendix A. Lower-level interactions are not reported for ease of presentation. Standard errors reported in parentheses are double clustered by time (fiscal year-end) and firms.

ID Robustness: Debt

Table ID.1: Maturity of U.S. Treasury debt and maturity of aggregate corporate debt

The table presents the estimates from weighted regressions of firm-level debt maturity on the average maturity of Treasury debt in the panel of U.S. public firms over 1975-2007. In columns (1) to (3), the dependent variable is the firm-year share of debt maturing in more than three years and the weight is equal to the firm-year outstanding debt scaled by total outstanding debt. In columns (4) to (6), the dependent variable is the firm-year share of debt maturing in more than one year and the weight is equal to the firm-year outstanding debt scaled by total outstanding debt. Government long-term bond supply is measured with the weighted-average maturity of Treasury debt. Details for variable definition in Appendix A. Standard errors reported in parentheses are clustered by firms.
